

Lessons Learned

Learnings

I learned about Hamiltonian Paths and Cycles and how to find them with an algorithm.

I also learned creating questions and finding wrong answer options.

I didn't really use python before, so I learned how to setup a python project and the basics about the language.

What went well

The communication within the group. We had regular team meetings and used a code base together.

What could have been better

Jack. Also the extra questions had a few problems, some answer options were wrong and 2 questions were there twice (and I really mean exactly the same).

The communication in our team about team members being sick wasn't great, but otherwise I would say the communication was good.

Our code base could have been better structured to more easily allow for different types of dynamic questions.
